

---

The number 1 most important thing for success in algebra 1 is learning to be able to do problem-solving and understanding how the formulas work. The number 2 most important thing for success in algebra 1 is learning how to use a worksheet technique that you understand and enjoy. A quartile is one-fourth of an entire population or sample, while a box plot shows vertical lines on each side of the reported data, which are then divided into boxes according to the quartiles of that particular data set. It is important that students understand that the data the teacher has measured the performance on is not sufficient for drawing conclusions about what is to be done with it. Even though classroom teachers, math experts, and mathematicians who develop algorithms etc., suggest that children should use quartiles to compare groups of scores, students often use this technique incorrectly. Quartiles are used for comparing one group of scores to another. The appropriate way to do this is to compare the total scores within each group, not just any two groups of scores. For example, if comparing heights, the appropriate way to compare heights would be to compare each group of heights. There are three approaches for comparing data using quartiles. The number 3 most important thing for success in algebra 1 is learning what other students are doing in class. One focus should be on understanding by doing and applying the different types of data that exists out there in the world. Good skills that should be learned by spending time observing others include: The number 4 most important thing for success in algebra 1 is asking questions and being willing to learn right away. The number 5 most important thing for success in algebra 1 is asking questions, listening to the teacher, and asking questions again. This chart shows the three main reasons to find out what other students did on their report card. This chart shows when it is appropriate to ask your teacher questions about your work.

The number 6 most important thing for success in algebra 1 is class participation. You can show that you are asking questions by joining in on class discussions, or by taking notes in class, or by volunteering for certain activities that help you learn algebra 1 concepts better. The number 7 most important thing for success in algebra 1 is physical fitness. Getting up to do the following stretching exercises every day for twenty minutes will make you feel better, keep you healthier, and make class easier for you. Your goal should be to do one more exercise or one more rep every time you stretch.

The number 8 most important thing for success in algebra 1 is listening well. The best way to show your teacher that you are willing to learn algebra 1 at home is by listening carefully in class. You can take notes on what needs to be learned or redo examples that were given in class by your teacher at home.

The number 9 most important thing for success in algebra 1 is using a worksheet system that works for you at home.
